Question 4

1/1 point (graded)

In the `contains-negative?` function you designed in an earlier question, which of these check-expects should appear first?

- ☐ `(check-expect (contains-negative? (cons 1 empty)) false)`
- ☒ `(check-expect (contains-negative? empty) false)`
- ☐ `(check-expect (contains-negative? (cons 1 (cons -1.5 empty))) true)`
- ☐ It doesn't matter which one appears first

**Explanation**

The base case test should always appear first for self-referential functions because it's the simplest and all the other tests depened on it being correct.
